FCC DECLARATION OF CONFORMITY

Renishaw plc declares that the products:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LTO2 series</td>
<td>Optical signal transmission systems.</td>
</tr>
</tbody>
</table>

have been manufactured in conformity with the following standards:

and that they comply with the requirements of the following directives (as amended):

89/336/EEC  Electromagnetic compatibility
73/23/EEC  Low voltage

The above information is summarised from the EC Declarations of Conformity, available from Renishaw on request.

FCC DECLARATION (USA)

**FCC Section 15.19**

This device complies with Part 15 of the FCC rules. Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received, including interference that may cause undesired operation.

**FCC Section 15.105**

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment.

This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case you will be required to correct the interference at your own expense.

**FCC Section 15.21**

The user is cautioned that any changes or modifications not expressly approved by Renishaw plc, or authorised representative could void the user's authority to operate the equipment.

**FCC Section 15.27**

The user is also cautioned that any peripheral device installed with this equipment such as a computer, must be connected with a high-quality shielded cable to insure compliance with FCC limits.
Safety

Only qualified persons should change the switch settings or replace fuses.

Where appropriate, remove the mains supply from units before removing covers.

Warranty

Equipment requiring attention under warranty must be returned to your supplier. No claims will be considered where Renishaw equipment has been misused, or repairs or adjustments have been attempted by unauthorised persons.

CNC machine

CNC machine tools must always be operated by competent persons in accordance with manufacturers instructions.

Caring for the probe / LTO2 OMP

Keep system components clean and treat the probe system as a precision tool.

Probe IP rating

IPX8

Related publications

As you install the LTO2 probe system, you will also need to refer to one or more of the publications listed below for details of how to install the ancillary equipment.

● *PSU3 power supply unit installation and user’s guide* – Renishaw part No. H-2000-5057.
LTO2 probe system components

The LTO2 probe system comprises the following main components:

- An LTO2 optical module probe (OMP).
- A 3D touch-trigger inspection probe (±X, ±Y and +Z directions). This is either a Renishaw LP2 or LP2H probe. The LP2 is more sensitive that the LP2H, which has a greater resistance to vibration and can support heavier styli. The probe is mounted in the OMP.
- An optical transmitter and receiver unit (OMM) and an MI 12 machine interface unit.
  The interface unit may be either a free-standing MI 12 interface unit or an MI 12 interface board.
- Alternatively, an optical receiver and machine interface unit (OMI) may be used instead of the OMM and MI 12 interface. This unit combines the functions of both the OMM and MI 12 in one unit.
- A PSU3 power supply unit. This is an optional unit. It provides a 24 V supply to the interface unit when a suitable power supply is not available from the CNC machine controller.
- Renishaw software for probe routines.
- LPE extension bars. One of these can be fitted between the OMP and the LP2 probe to provide greater access to workpiece features.
- MA4 90° adaptor. This allows the LP2 probe to be mounted at 90° to the machine turret and set through 360°.
Operation

The LTO2 OMP is mounted in a tool position on the lathe turret and receives and transmits optical signals. Power for operation is provided by an internal battery. A 3D touch-trigger inspection probe, either an LP2 or LP2H, is mounted on the OMP.

A workpiece setup and inspection cycle may be included at any stage of the machining process. When a cycle is initiated, signals pass from the CNC control to the OMP, via MI 12 and OMM units. Signals also return along the same route.

The MI 12 interface unit converts the probe signals into the correct format for the CNC machine control.

Instead of the OMM and MI 12 combination, an OMI may have been installed. This process signals in the same way as the OMM and MI 12.

Using two OMMs

If it is not possible for one OMM to cover the full range of movement of the LTO2 OMP, a second OMM may be added. The reception cones of the OMMs are arranged to overlap so that they act as one receiver over the area they cover.

Remote indication

When the inspection probe contacts a surface, a PROBE STATUS LED on the MI 12 changes state and a bleep is emitted.

If the MI 12 is hidden from the operator, an optional remote lamp or bleeper may be placed in a position where it is easily seen or heard.

Operating envelope

*See pages 11 and 13.*

Natural reflective surfaces within the machine may increase the signal transmission range.

Performance plots in the ambient temperature range 5° to 50° C (41° to 122° F) are shown on pages 11 and 13.

Operation in temperatures of 0° to 5° C or 50° to 60° C (32° to 41° F or 122° to 140° F) will result in some reduction in range.

---

CAUTION

- Switch power off when working inside electrical components.
- The probe is a precision tool. Always handle it with care.
- Before using the probe, ensure it is firmly secured in its mounting.

Regular maintenance

Although Renishaw probes require little maintenance, the performance is adversely affected if dirt, chips or liquids are allowed to enter the sealed working parts. Therefore keep all components clean and free from grease and oil. Periodically check cables for signs of damage, corrosion or loose connections.

Cleaning

Coolant residue accumulating on the probe transmitter LEDs and receiving diode, and on the OMM or OMI windows has a detrimental effect on transmission performance.

Wipe clean as often as is necessary to maintain unrestricted transmission.
LTO2 and OMM

The diodes of the LTO2 OMP and OMM must be mutually in the others field of view and within the performance envelope shown on the page opposite.

Switch On/Off range

The LTO2 OMP must be within 4 m (13.12 ft) of the OMM.

Operating range

The LTO2 OMP must be within 4 m (13.12 ft) of the OMM.

Rotation of the LTO2 OMP window is to be within ±20 degrees of the optical centreline.

Installation is the responsibility of your Renishaw supplier or the machine tool manufacturer. Information is given in this section to assist in overcoming basic problems. You are recommended to seek specialist advice where this is appropriate.

Cable routing and electrical interference

Care should be taken to ensure that signal cables are routed away from high current sources, e.g. high current cables, axis drive motors and 3-phase transformers.

Optical interference

Renishaw optical transmission systems are designed to be immune from normal optical interference. However there is a level above which powerful light sources will interfere with the optical system.

There are two categories of interference:

- Intermittent light sources
- Local strong continuous light sources

Intermittent light sources

Rotating-type beacons with incandescent light source

This type of beacon will not cause interference unless:

- it is situated within two metres of the OMM, and
- its mirror reflects light directly at the OMM.

Xenon-type beacons

This type of beacon produces fast, very powerful pulses of light and cannot safely be used near the OMM. It is undesirable to operate the system in an environment that contains Xenon beacons, i.e. on machine tools or AGVs.

Arc, MIG or TIG welding

These can produce optical interference similar to that of a Xenon beacon. Xenon beacon restrictions therefore apply.
Other interfering light sources

It is possible that fast changes in light levels, e.g. a match being struck or a lighter being lit, will cause errors if the source is within 500 mm of the OMM window. Abnormal changes in light levels must therefore be avoided.

**Local strong continuous light sources**

- If fluorescent lamps are used for workpiece lighting, the OMM should be kept at a distance of at least one metre from the source.

- If quartz halogen lamps of greater than 60 W are used, the OMM should be kept at a distance of at least two metres from direct emission from source.

- It should also be noted that direct sunlight should not be allowed to shine on the OMM window, as this could cause errors.

If it is not convenient to maintain these distances and any of the problems listed above are experienced, then a shield (similar to a camera lens hood) can be used to shield the OMM from direct contact with the interference.

**CAUTION**: If two systems are operating in close proximity to each other, take care to ensure that signals transmitted from the OMP on one machine are not received by the OMM or OMI on the other machine, and vice versa.

**OMM and OMI positioning**

To assist finding the optimum position of the OMM during system installation, signal strength outputs are available on the MI 12 interface.

OMI signal strength is displayed on an OMI multi-coloured LED.
Probe mounting and stylus on-centre adjustment

Probe mounting

The LTO2 OMP mounts directly in the lathe turret.

1 Align the OMP with the OMM/OMI then clamp the OMP in the turret. The probe can now be moved relative to the OMP.

On-centre adjustment

On-centre adjustment of the stylus is carried out using the on-centre adjuster ring. Use it to adjust the stylus tip so that it corresponds with the nominal tool tip position.

1 Slacken screws A between a quarter-turn and a half-turn. The spring washers will maintain a light grip.

2 Place the adjuster ring onto the OMP, and position it with one set of opposing screws B in line with the Y-axis of the machine.

3 Tighten screws C.

4 Adjust screws B to move the probe. Progressively slacken one screw and tighten the opposite screw as the final setting is approached. Use two hexagon keys to do this.

5 When the stylus is correctly positioned, tighten screws A to 2.6 Nm (1.91 lbf.ft).

6 Slacken screws B and C and remove the adjuster ring.
MA4 90° adaptor

This adaptor enables the probe to be mounted at 90° to the machine spindle centre line. This extra versatility allows the probe to reach otherwise inaccessible workpiece features.

1 Screw the MA4 into the OMP and tighten it with the C spanner to 10–12 Nm (7.37–8.84 lbf.ft). The C spanner is also used to tighten the LP2 or LP2H probe in its mounting.

2 Slacken the three screws A.

3 Rotate the MA4 to any position through 360°.

4 Tighten the three screws A to 1.1 Nm (0.81 lbf.ft).

5 Screw the LP2 or LP2H probe into the MA4 adaptor and tighten it with the C spanner to 10–12 Nm (7.37–8.84 lbf.ft).

LPE extension bars (not shown)

Extension bars up to 150 mm long can be fitted between the MA4 and the probe using the C spanner provided.
Modes of operation

The LTO2 has two modes of operation:

1. **Standby mode** – the OMP uses only a small current while passively waiting for the switch-on signal. This helps conserve battery life.

2. **Operating mode** – this is activated by one of the methods described in “Switch-on options”. Signals are transmitted by the probe only during the operating mode.

LTO2 power on/off

LTO2 power switch on/off occurs only when the LTO2 is located within the switch on/off envelope of the OMP and OMM/OMI.

Debounce time

After the probe is switched on a time delay must occur before it can be switched off. This is known as the debounce time. The delay is factory set to 5 seconds, but it can be reset to 9 seconds by resetting the internal switch. A similar delay occurs after the probe is switched-off and before it can be switched on again.

Switch-on options

Three options are provided for switching on the LTO2. These are selected by switches on the MI 12 or OMI (for details, see the MI 12 or OMI guides).

1. **Manual start** (Optical-on). This is initiated by the MI 12 start button (on the OMM version only).

2. **Machine start** (Optical-on). This is initiated by a software M-code command (*factory set mode*).

3. **Auto start** (Optical-on). This causes the system to send an optical start signal once every second and does not require a machine control input.

**NOTE:** Auto start should not be selected when the LTO2 is set to the Optical-on/Optical-off option. (An Auto start signal will force the LTO2 to switch on and then off at 5 or 9 second intervals.)
After the probe is switched on, the debounce time must elapse before the probe can be switched off.

**Switch-off mode (Timeout)**

A timer switch automatically returns the probe to the standby mode after a selected time interval. Four timeout options are provided – 5 seconds, 9 seconds, 33 seconds and 134 seconds. The timer is factory set to 33 seconds. Other timeout periods are selected by resetting an internal switch.

When the timeout period is set to either 33 seconds or 134 seconds, the timer is reset for a further 33 or 134 seconds each time the probe triggers during the operating mode.

When the timeout period is set to either 5 seconds or 9 seconds, the timer is not reset each time the probe triggers during the operating mode.

**NOTE:** A start signal received during the time the probe is on has no effect on the timeout.
IMPORTANT: Only qualified persons should change the switch settings.

Gaining access to the switch

1 Remove the two screws (1) and washers (2, 3) that secure the front plate (4) (see the figure on the page opposite).

NOTE: Wires are attached to the back of the front plate (4). Do NOT pull off the plate but ease it off carefully.

2 Remove the front plate (4), taking care not to strain the wires. The Dual-In-Line (DIL) switch (5) is now accessible.

3 If the O-ring shows signs of damage and needs to be replaced, unsolder the wires from the front plate (4).

Switch settings

NOTE: When changing the switch settings:

● Do not touch electronic components.
● Do not strain or disconnect wires.
● Do not use the tip of a pencil to change the settings.
● Keep all components clean – do not allow coolant or particles to enter the probe body.

The functions and factory settings of the switches are shown on the figure on the page opposite.

Refitting the front plate

When the front plate of the probe is removed, the O-ring seal that protects the electronics is disturbed.

1 To ensure that the integrity of sealing is maintained when the front plate is refitted, check the condition of the O-ring and replace it if necessary. Grease the O-ring before fitting it.
2 If the wires were unsoldered to allow the O-ring to be replaced, resolder them to the back of the front plate (4).

3 Refit the front plate (4).

4 Refit the two flat washers (3), dished washers (2) and screws (1). Tighten the screws to 2.4 – 2.6 Nm (1.76 – 1.91 lbf.ft).

* Factory set
Low battery indication

When either the MI 12 or OMI low battery LED lights up, battery voltage is low and the end of useable battery life is approaching.

The low battery LED only lights during the probe operating mode.

The machine control may also be programmed to flag up a low battery alarm.

The OMI or MI 12 interface low battery LED lights when the battery needs to be replaced. Replace the battery as soon as is practicable following a gauging cycle.

Removing the battery

1. If the end cover is not accessible, remove the LTO2 OMP from the machine turret.
2. Unscrew the end cover with a 3 mm hexagon key.
3. Remove the battery.

Replacing the battery

1. Insert the battery into the battery compartment, positive (+) end first.
2. Refit the end cover and tighten to 1.0 Nm (0.74 lbf.ft).
3. Refit the LTO2 OMP in the turret (if removed).
4. If the LTO2 OMP has been removed from the turret, recalibrate the probe system before use.

DO NOT allow coolant or debris to enter the battery compartment.

DO NOT leave an exhausted battery in the probe. Dispose of an exhausted battery in accordance with local regulations.

### POOR PROBE REPEATABILITY
- Probing occurs within machine’s acceleration and deceleration zones.
- Probe feedrate too high.
- Temperature variation causes excessive machine and workpiece movement.
- Machine has poor repeatability due to loose encoders, tight slideways and/or accident damage.

### PROBE FAILS TO SWITCH OFF
- Probe is in Timeout mode.
- Turret indexed, while the probe is switched on.
- Probe is inadvertently switched on by OMM/OMI.

**OMM, OMI, MI 12 and PSU3**
The MA4 90° adaptor and extension bars are described in Renishaw data sheet AEH H-2000-2120.

**MA4 90° adaptor**

The adaptor enables the LP2 probe to be mounted at 90° to the machine turret, and set through 360°.

The MA4 uses the same M16 thread as the LP2.

**LPE extension bars**

Further reach may be obtained by fitting an LPE extension bar between the LP2 probe and LTO2T OMP.

Extension bars use the same M16 thread as the LP2 probe. Only one extension bar is permitted per installation.
