

See things in a different light

There are many ways to identify and analyse materials.

Raman chemical imaging uses scattered light to help you understand the structure and composition of your materials.

Renishaw has decades of experience developing research grade Raman microscopes that can generate chemical images. We do Raman because it's fast, yet gentle and highly specific.

With the inVia Raman microscope, you can see the small things, the large things and things you didn't even know were there. Chemical imaging with inVia will shed light on questions you didn't even ask.
